Developing Evidence-based Programming for Delinquent Youth: The Standardized Program Evaluation Protocol

Mark W. Lipsey

July, 2013

What Is Evidence-based Practice?
A definition for JJ adapted from the origins of the concept of EBP in medicine

Evidence-based practice is the conscientious, explicit, and judicious use of current best evidence in making decisions about the care of individual juveniles. The practice of evidence-based juvenile justice means integrating practitioner expertise with the best available external evidence from systematic research.

Main elements of evidence-based juvenile justice practice

- Risk assessment:
  - probability of reoffending

- Disposition matrix:
  - risk-based level of supervision

- Needs assessment:
  - matching of program to need

- Effective prevention, treatment, and re-entry programs:
  - proven to reduce recidivism
Evidence-based programs
Effective programs: What constitutes methodologically credible evidence?

Results from well executed research designs capable of producing unbiased estimates of intervention effects:

- Randomized experiments
- Quasi-experiments with well-matched comparison groups
- A few other rarely used specialized research designs (e.g., regression-discontinuity)
The prevailing definition of EBP: A certified “model” program

The P part: A ‘brand name’ program, e.g.,
- Functional Family Therapy (FFT)
- Multisystemic Therapy (MST)
- Big Brothers/Big Sisters mentoring
- Aggression Replacement Training (ART)

The EB part: Credible research supporting that specific program certified by, e.g.,
- Blueprints for Violence Prevention
- OJJDP Model Programs Guide
- CrimeSolutions.gov
- NREPP (National Registry of EB Programs & Practices)

Some limitations of the model program approach

- The evidence base is often thin—relatively few studies of each model program
- Few of these programs are actually used in juvenile justice systems
- These programs present organizational challenges—cost and the ability to implement them “by the book”
- Most easily implemented as a new start-up; little utility for improving existing programs
An alternative perspective on the P in EBP: Generic program “types”

- Interventions with research on effectiveness can be described by the *types* of programs they represent rather than their brand names, e.g.,
  - family therapy
  - mentoring
  - cognitive behavioral therapy
- These types include the brand name programs, but also many ‘home grown’ programs as well
- Viewed this way, there are many evidence-based program types familiar to practitioners

Generic Program Types that are Effective for Reducing the Recidivism of Juvenile Offenders
Meta-analysis of a comprehensive collection of existing studies of interventions for juvenile offenders

- Studies: 500+ experimental and quasi-experimental studies
- Samples: Juveniles in programs aimed at reducing delinquency
- Outcomes: Focus on the programs’ effects on recidivism (reoffending)

Program types sorted by general approach: Average recidivism effect

[Bar chart showing average recidivism effect for different program types: Discipline, Deterrence, Surveillance, Restorative, Skill building, Counseling, Multiple services, and Therapeutic approaches. The chart illustrates the percentage reduction from a baseline of .50.]
Further sorting by intervention type within, e.g., counseling approaches

Further sorting by intervention type within, e.g., skill-building approaches
Many *types* of therapeutic interventions thus have evidence of effectiveness … but there’s a catch:

Though their *average* effects on recidivism are positive, larger and smaller effects are distributed around that average.

This means that some variants of the intervention show large positive effects, but others show negligible or even negative effects.

**Example: Recidivism effects from 29 studies of family interventions**
Where are the brand name model programs in this distribution?

Example: Recidivism effects from 58 studies of CBT
Mix of brand name and home grown programs

Effect sizes analyzed as a function of study and program characteristics

- **Study methods**: e.g., design, measurement
- **Sample characteristics**: e.g., age, gender, ethnicity, risk
- **Juvenile justice control**: e.g., diversion, probation, incarceration
- **Type of program**: e.g., intervention philosophy, treatment type
- **Program implementation**: e.g., amount of treatment, completion rates, quality of implementation

Effect sizes for recidivism outcomes
Key Findings

Type of program matters

- Programs using control approaches on average have small or even negative effects on recidivism
- Programs using therapeutic approaches on average have positive effects
- Within the therapeutic category, program types differ widely in their average effects with some notably more effective than others
Service amount and quality matters

Effects on recidivism associated with:
- Duration of service
- Total hours of service
- Quality of implementation
  - Explicit treatment protocol
  - Personnel trained in that treatment
  - Monitoring of treatment delivery
  - Corrective action for drift in delivery

Some characteristics of the juveniles matter

Effects on recidivism associated with:
- Delinquency risk (better outcomes)
- Aggressive history (somewhat less positive outcomes)

Effects on recidivism not associated with:
- Mean age
- Gender mix
- Ethnicity
JJ supervision doesn’t matter much
(with risk controlled)

With risk accounted for, effects on recidivism
not associated with:
- No JJ supervision (prevention programs)
- Diversion
- Probation/parole
- Incarceration

To have good effects, interventions should be implemented to match the most effective practice as found in the research

- Program type: Therapeutic approach and one of the more effective intervention types
- Dose: Amount of service that at least matches the average in the supporting research
- High quality implementation: Treatment protocol and monitoring for adherence
- Risk: Larger effects with high risk juveniles
Points assigned proportionate to the contribution of each factor to recidivism reduction

Target values from the meta-analysis (generic) OR program manual (manualized)

Previous Work in Arizona: SPEP Validation Study
Distribution of SPEP scores across 66 Arizona probation programs

73% have scores < 50

Estimate expected recidivism for AZ programs with SPEP scores based on pre-existing risk factors

Recidivism predicted from archival data on:
- number and nature of prior offenses
- risk rating by probation officers
- age, sex, race, county
- number of prior service events

Actual recidivism: .27 at 6 mo, .44 at 12 mo
Actual vs. predicted recidivism for providers with scores ≥ 50 and < 50

- 6-mo recidivism difference: High score
- 6-mo recidivism difference: Low score
- 12-mo recidivism difference: High score
- 12-mo recidivism difference: Low score

Replication with 90 SPEP Rated Programs Serving 3571 Youth

- 11 %-point recidivism difference
- 7 %-point recidivism difference

Source: Redpath & Brandner, 2010
Summary

- No one approach to EBP: There are different definitions of practice with correspondingly different bodies of evidence.
- Meta-analysis can be used to develop evidence-based practice profiles for generic interventions with wider applicability than the model program approach.
- Real world programs that better match those EBP profiles do indeed show better outcomes.

More generally …

- We currently have sufficient research and evidence-based tools to improve the outcomes and cost-effectiveness of most JJ systems.
- The main barriers are organizational—implementing and sustaining evidence-based tools and practices in routine JJ operations.
Thanks!
